

Kiplin Metals to Conduct IP/DC- Resistivity Survey on the CLR Uranium Project, Athabasca, Saskatchewan, Canada

09.02.2022 | [The Newswire](#)

[Kiplin Metals Inc.](#) (TSXV:KIP) (the "Company" or "Kiplin") is pleased to announce the exploration plan for its wholly-owned Cluff Lake Road (CLR) Uranium Project in northeast Saskatchewan. The Company intends to complete a detailed IP/DC-Resistivity survey of high priority target zones, identified through ground geophysics and radon gas emission testing. The survey will be conducted in an east-west orientation, with 100m spacing. Data from the 2022 survey will be combined with datasets from previous surveys completed jointly by Fission 3.0 Corp. and Zadar Ventures. The purpose of the 2022 survey is to define high value diamond drilling targets.

The Company is very excited about the CLR project, particularly given the success at the Shea Creek deposit, which is located ~29km to the north, along the Cluff Lake Road, and has an indicated mineral resource of 67.66 million pounds of uranium (2,067,900 tonnes grading 1.48% U₃O₈) and an inferred mineral resource of 28.19 million pounds of U₃O₈ (1,272,200 tonnes grading 1.01% U₃O₈) (Technical Report by Eriks P. Geo. 2013).

The Company will provide updates on the timing of its exploration plans as they come available.

Dr. Peter Born, P.Geo., is the designated qualified person as defined by National Instrument 43-101 and is responsible for, and has approved, the technical information contained in this release.

About Kiplin Metals Inc.

[Kiplin Metals Inc.](#) is a mineral exploration company. We create value for our shareholders by identifying and developing highly prospective mineral exploration opportunities. Our strategy is to advance our projects from discovery all the way to production. This vertically integrated strategy allows Kiplin Metals to achieve exceptional shareholder value through the entire life-cycle of the mining process.

Cluff Lake Road Uranium Project. Kiplin Metals has the right to earn a one-hundred percent interest in the Cluff Lake Road Uranium Project (the "CLR Project"). The CLR Project covers ~531ha in the southwestern Athabasca Basin in northern Saskatchewan, where several new discoveries, including the Arrow and Tripe R Uranium deposits have been made. The CLR Project is 5km east of the Cluff Lake Road (Hwy 955), which leads to the historic Cluff Lake Mine, which historically produced approximately 62,000,000lbs of yellowcake uranium.

Exxeter Gold Project covers an area of 715ha located in Val d'Or Quebec, one of the premier gold camps in the world which produced over 113.4M oz Au by the end of 2019. The project covers 3.8km of the Cadillac Tectonic zone, which is the principal geologic structure responsible for cold mineralization in the Val d'Or.

The Lac Rochester Copper Project is located on the eastern border of the Val d'Or mining camp, 50km southeast of the city of Val D'Or, and 14km south of the Company's Exxeter Gold property. Historical exploration of the Lac Rochester Copper Project identified multiple high copper and iron values, concurrent with a large, northeast trending magnetic anomaly.
